

AI Agents — The Future Is Now

45-Minute Presentation Script for 3 Speakers

Slides 1–20 • 3 Sections • 15 Minutes Per Speaker

SPEAKER	SECTION	SLIDES	TIME
Speaker 1	Introduction & How AI Agents Work	Slides 1–7	0–15 min
Speaker 2	Applications, Tools & Real-World Examples	Slides 8–14	15–30 min
Speaker 3	Market, Future & How to Get Started	Slides 15–20	30–45 min

■ Stage Direction / Action	■ Presenter Tip	■ Pause / Transition Cue
----------------------------	-----------------	--------------------------

PPT Improvement Recommendations

Before you present, here are some things you can add to make the slides even better:

■ Slide 4 — Add a Real Example

Under the AI Agent vs Regular AI table, add one short sentence: 'Example: Ask ChatGPT to book a flight and it will tell you HOW. Ask an AI Agent and it ACTUALLY books the flight for you.' This makes the difference very clear.

■ Slide 5 — Add a Story Example

Below the Perceive-Think-Act-Remember loop, add a simple story: 'Example: You ask an agent to plan your trip. It PERCEIVES your request, THINKS about flights and hotels, ACTS by booking them, then REMEMBERS your seat preference for next time.'

■ Slide 8 — Add 1–2 Indian Company Examples

Add examples from India like Zomato, Swiggy, or HDFC to make it relatable for an Indian audience. Example: 'Zomato uses AI agents to predict delivery times and assign delivery partners.'

■ Slide 9 — Explain the Chart

The industry chart needs a 2-line caption explaining what it shows. Right now it just says 'Source: Gartner'. Add: 'Healthcare and Finance are the fastest adopters. Retail and Education are growing quickly too.'

■ Slide 13 — Add a Comparison to Human Work

Next to the '100x faster' stat, add: 'A human researcher takes 4 hours to write a report. An AI Agent does it in 2 minutes.' Numbers with context hit harder.

■ Slide 15 — Break Down the \$102 Billion Number

Add a simple line: 'That means every year, companies are spending more on AI agents than the total GDP of some small countries.' Makes the number feel real.

■ Slide 16 — Add a 'No Coding' Option

Many people in the audience may not be technical. Add a note: 'You don't need to code — tools like Zapier, Make.com, and ChatGPT Custom Actions let anyone build simple agents without writing any code.'

■ Slide 17 — Add Difficulty Levels

You already have Beginner/Intermediate/Advanced — great! Just add one sentence about which framework to START with: 'If you're new, start with LangChain. It has the most tutorials online.'

■ Slide 18 — Add a 'What This Means for Jobs' Note

The audience will wonder about this. Add: 'AI Agents won't replace people — but people who use AI Agents will replace people who don't. The skill is learning to manage and direct agents.'

■ Slide 19 (Summary) — Add a One-Line Action Point

End the summary with one clear thing to do: 'This week: try ONE AI agent tool — ChatGPT, Claude, or Copilot — for any task you do repeatedly.' Action beats inspiration.

SLIDE 1 · Title — AI Agents: The Future of Intelligent Automation

■ Walk to the front. Make sure everyone can see the screen. Smile and take a breath before you start.

Hello everyone! My name is [your name], and these are my two co-presenters — [Name] and [Name]. Today we are going to talk about something really exciting — AI Agents.

Now, you might have heard about AI before — maybe you have used ChatGPT or Google's AI. But AI Agents are something different. They are not just tools that answer questions. They can actually **think, plan, and do things on their own** — without you needing to tell them every single step.

In the next 45 minutes, the three of us will walk you through: what AI Agents are, how they work, where they are used today, and — most importantly — why YOU should care about them right now.

■ Pause. Look around the room. Let that sink in.

SLIDE 2 · Overview — What We'll Cover

Let me quickly show you what we have planned. We have split this presentation into three parts.

- I will start by explaining what AI Agents are and how they work — the basics.
- **[Speaker 2]** will then show you where AI Agents are used in the real world today.
- **[Speaker 3]** will finish by talking about the future, the market, and how you can get started yourself.

■ Point to each section on the screen as you mention it. This helps the audience follow along.

SLIDE 3 · Definition — What is an AI Agent?

So — what exactly is an AI Agent? Let me give you a simple way to think about it.

Think about a **new employee at a company**. When they get a task, they do not need you to stand over them and tell them every little step. They read the task, figure out the best way to do it, and then they go and complete it. If they hit a problem, they figure it out.

An AI Agent works the same way. You give it a goal. It figures out the steps. It does the work. Done.

On the slide you can see three words: **Autonomous, Goal-Oriented, and Intelligent**. Autonomous means it works by itself. Goal-oriented means it is always trying to finish a task. Intelligent means it makes smart choices along the way.

■ Ask the audience: 'How many of you have used ChatGPT before?' Wait for hands. 'Great — well, an AI Agent is ChatGPT that can actually DO things, not just talk about them.'

SLIDE 4 · Comparison — AI Agent vs Regular AI

Now let me show you the big difference between a regular AI — like ChatGPT — and an AI Agent.

If you ask ChatGPT to book you a flight, it will tell you *how* to book one. It gives you steps. You still have to do the work yourself.

An AI Agent? You say 'Book me a flight to Delhi next Friday under 5,000 rupees.' It opens the travel website, searches for flights, picks the best one, and books it. **You did not do anything.**

Look at the slide — on the left you see what regular AI cannot do. On the right, what an AI Agent can. The biggest differences are: AI Agents can **plan multiple steps**, they can **use tools** like email and websites, and they can **act on their own** without waiting for your next message.

■ Walk to the screen and physically point to 'Left' (ChatGPT) and 'Right' (AI Agent). Use your hands. Movement keeps people awake.

SLIDE 5 · How It Works — The Brain of an AI Agent

Now let me show you exactly HOW an AI Agent thinks. It has four steps, and they go in a loop.

Step 1 — PERCEIVE. The agent first reads and understands the task. It takes in information — your words, files, websites, emails, whatever is available.

Step 2 — THINK. Now it plans. It asks itself: 'What is my goal? What do I need to do first? What comes after?' It breaks the big task into small steps.

Step 3 — ACT. It actually does something. Sends an email. Searches the web. Writes some code. It does not just think — it takes real action.

Step 4 — REMEMBER. After each action, it stores what happened. It learns from what worked and what did not. It uses this to make better decisions next time.

And then it starts again — Perceive, Think, Act, Remember — over and over until the job is done.

■ Pause here. Say: 'This loop is the secret behind every powerful AI Agent. Once you understand this, everything else makes sense.'

SLIDE 6 · Types — Types of AI Agents

Not all AI Agents are the same. Just like there are different kinds of workers — some are simple, some are complex — AI Agents also come in different types.

Simple Reflex Agents are the most basic. They just react to what is happening right now — like a thermostat that turns on the AC when it gets too hot. No memory, no planning.

Model-Based Agents are smarter. They remember what happened before and use that history to make better choices.

Goal-Based Agents have a specific target they are trying to reach, and they plan multiple steps to get there.

Utility-Based Agents do not just pick any solution — they pick the BEST one. Like choosing the fastest AND cheapest flight, not just any flight.

Learning Agents get better over time. Every task makes them smarter. These are the most powerful ones today.

Multi-Agent Systems — and this is the really exciting one — are teams of AI agents working together. We will hear more about this from my co-presenters.

SLIDE 7 • Components — Key Components of an AI Agent

Think of an AI Agent like a person. Every person has a brain, eyes and ears, a memory, hands to do work, and a way to plan. An AI Agent has the same five things.

- **LLM Brain** — this is the thinking engine. It is the AI model, like GPT-4 or Claude, that understands language and reasons.
- **Perception** — this is how it reads the world: your instructions, files, websites, emails.
- **Memory** — it stores what it has done before so it does not start from zero every time.
- **Tools** — these are the hands. It can use web search, send emails, run code, and access databases.
- **Planning** — it breaks big goals into small steps and decides what to do first.

When all five work together, you get a powerful, autonomous agent that can handle complex real-world tasks.

■ End your section here. Say: 'Now that you know *WHAT* they are and *HOW* they work, [Speaker 2] will show you *WHERE* they are being used in the world today. [Speaker 2], over to you!'

Thank you, [Speaker 1]! My name is [your name]. I am going to show you the fun part — where AI Agents are actually being used right now, what tools they use, and what benefits they bring.

SLIDE 8 · Applications — Where AI Agents Are Used Today

AI Agents are already everywhere around us. Let me walk you through six places where they are working right now.

Customer Support. Have you ever chatted with a support bot on a website and it actually solved your problem without transferring you to a human? That is an AI Agent. It reads your complaint, checks your account, and fixes the issue — all by itself, 24 hours a day.

Coding Assistants. Tools like GitHub Copilot can write code for you, find bugs in your code, and even run tests — just by reading your instructions in plain English.

Finance and Trading. Stock trading agents can read market data and make buy/sell decisions in fractions of a second — much faster than any human trader.

Research Agents. Give it a question, and it will browse the internet, read articles, and give you a full summary — in minutes, not days.

Travel Planning. An agent can check flights on one website, hotels on another, compare prices, and book everything — all from one instruction.

Cybersecurity. These agents watch your computer networks all day and all night. The moment something strange happens, they block it automatically.

■ For each category, pause briefly and ask if anyone has personally experienced that kind of AI. It makes the content feel closer to home.

SLIDE 9 · Data — AI Agent Adoption by Industry

This chart from Gartner — one of the world's most respected research firms — shows how quickly different industries are adopting AI Agents.

Healthcare and Finance are at the top because they have the most to gain from speed and accuracy. Retail and Education are catching up fast. The key message here is simple: **every single industry is moving in the same direction.** This is not a trend in just one sector — it is everywhere.

SLIDE 10 · Tools — AI Agents Use Tools Like Humans

Here is a really simple way to understand this slide. Think about YOU at work. You use Google to search for information. You use email to send messages. You use Excel to manage data.

An AI Agent does the same thing — it uses tools. But it uses them on its own, without you clicking anything.

- **Web Search** — it Googles things for you.
- **Code Executor** — it can write and run computer code.
- **Database** — it reads your company's data and writes to it.
- **APIs** — it connects to external services like weather, payments, maps.
- **Email / Chat** — it sends messages on your behalf.
- **File System** — it reads and writes documents and files.

■ Say: 'The more tools you give an agent, the more powerful it becomes. It is like hiring someone and giving them access to more and more resources.'

SLIDE 11 · Examples — Popular AI Agents You Know

Now let me introduce you to some AI Agents that real companies are using today.

AutoGPT was one of the first popular AI Agents. You give it a goal and it tries to achieve it on its own — searching the web, writing files, planning tasks.

Devin by Cognition AI is called the world's first AI software engineer. You describe a software feature and it actually builds and tests the code for you.

Microsoft Copilot is inside Microsoft Office. If you use Word or Outlook, you may have already seen it. It can draft emails, create PowerPoint slides, and summarise long documents — in seconds.

Salesforce Agentforce handles customer service. When a customer raises a complaint, the agent reads it, checks the order, and resolves it — without any human touching it.

■ Say: 'You may have already used some of these without knowing they were AI Agents. They do not look like robots — they look like features inside normal apps.'

SLIDE 12 · Advanced — Multi-Agent Systems: Teamwork!

Now here is where things get really interesting. Instead of one AI Agent doing everything, what if you had a **team of AI Agents** — each one an expert at something different?

That is exactly what Multi-Agent Systems are. There is one **Manager Agent** at the top. It receives the big task, breaks it into pieces, and gives each piece to a specialist agent.

For example: 'Create a marketing campaign.' The Manager Agent sends the research to the **Research Agent**, the writing to the **Writing Agent**, the email delivery to the **Email Agent**, and the code for the landing page to the **Coder Agent**. They all work at the same time — in **parallel**.

The result? A complex job that used to take a team of humans a week is done in hours — or even minutes.

SLIDE 13 · Benefits — Why AI Agents Are Powerful

Let us quickly walk through the six biggest benefits of AI Agents.

100x Faster. A task that takes a human 4 hours can be done in minutes. No exaggeration.

99.9% Accuracy. Humans get tired and make mistakes. AI Agents do not get tired — ever.

Unlimited Scale. One agent can do 1,000 tasks at the same time. You cannot hire 1,000 people for that.

60% Cost Saving. Companies that deploy agents are cutting their operational costs by more than half.

24/7 Always On. No sick days, no holidays, no overtime. It works while you sleep.

Gets Smarter Over Time. The more tasks it completes, the better it gets at doing them.

Together these benefits mean that a small team using AI Agents can do the work of a much larger team. That changes everything about how businesses operate.

■ *End your section. Say: 'But it is not all perfect — there are real challenges too. I will hand over to [Speaker 3] after this next slide on challenges.'*

SLIDE 14 · Challenges — Challenges & Limitations

It is important we are honest about the problems too. AI Agents are powerful, but they are not perfect.

Hallucinations. Sometimes an AI Agent will confidently do something wrong or make up information. This is why you always need a human to check important decisions.

Security Risks. If someone tricks the agent with bad instructions — called a 'prompt injection attack' — it could do harmful things. Security around agents is a serious concern.

Cost. Every time an AI Agent 'thinks', it uses computing power. For very complex tasks with many steps, this can get expensive.

Over-Automation. If you let agents run completely without supervision, mistakes can snowball. Human oversight is still very important.

Privacy. Agents need access to data to work. You have to be careful about what data you give them access to.

■ *Say: 'These are real challenges, but they are being solved fast. Every month the technology gets more secure and more reliable. Now let me pass to [Speaker 3] for the market picture and how to get started.'*

Thank you, [Speaker 2]. My name is [your name]. I am going to wrap up with three things: how big this market is, what the future looks like, and most importantly — what you can do TODAY.

SLIDE 15 · Market Data — The AI Agent Market is Exploding

Let me give you one number that tells the whole story: **102 billion dollars by 2028.**

The AI Agent market is growing at 45% every single year. That means it is almost doubling in size every two years. To give you some context — that is faster than the internet grew in the late 1990s.

Every major company in the world — Google, Microsoft, Apple, Amazon, Salesforce — is racing to build and sell AI Agents. This is not a small niche. This is the next big platform, like the smartphone was in 2008.

■ Pause and let the number land. Then say: 'If this was any other sector growing at 45% per year, every single investor in this room would want a piece of it. AI Agents IS that sector.'

SLIDE 16 · Build — How to Build a Simple AI Agent

Now — how do you actually build one? I promise it is not as complicated as it sounds. There are six steps.

Step 1 — Define the Goal. Be very specific. Do not say 'help with emails.' Say 'answer customer support emails about delivery delays within 2 hours.'

Step 2 — Choose the Brain. Pick an AI model — GPT-4, Claude, or Gemini. This is the thinking engine inside your agent.

Step 3 — Give It Tools. Connect it to the things it needs — web search, your company database, email system.

Step 4 — Add Memory. Let it remember past conversations using tools like Pinecone or ChromaDB. This makes it smarter over time.

Step 5 — Set Safety Rules. Always define what the agent should NOT do. And always keep a human in the loop for important decisions.

Step 6 — Test and Improve. Run it in the real world, watch what it gets wrong, and fix it.

■ Not a developer? No problem. Tools like Zapier, Make.com, and ChatGPT Custom Actions let you build simple agents without writing a single line of code.

SLIDE 17 · Frameworks — Popular AI Agent Frameworks

If you want to build something more powerful, these are the tools that developers use.

LangChain is the best place to start. It is the most popular, has the most tutorials online, and supports all major AI models.

AutoGen by Microsoft is great for making multiple agents talk to each other and solve problems together.

CrewAI lets you build a whole team of agents — each with their own role, like 'Researcher', 'Writer', or 'Reviewer'.

LangGraph is for more complex workflows where you need agents to follow specific paths and decision trees.

■ Say: 'If I had to recommend just ONE to start with — LangChain. Go to langchain.com, follow their 'Getting Started' tutorial, and you will have your first simple agent running in one afternoon.'

SLIDE 18 · Future — The Future of AI Agents

Where is all of this going? Here is a simple timeline.

2024 — Today: Agents that can use tools. They browse the web, run code, read files. This already exists.

2025 — Coming Soon: Agents that can handle very long, complex tasks — running for hours or even days without needing you to check in.

2026–2027: Physical AI Agents. These are robots and machines controlled by AI — already being tested in warehouses and factories.

2028–2030: Society-scale AI. Agents managing city traffic, hospital scheduling, supply chains. This sounds big because it IS big.

And here is the most important quote of this entire presentation, from Sam Altman, the CEO of OpenAI:

■ "Agents will do the work of a small company. Humans will manage agents, not tasks." — Sam Altman, OpenAI

That is the future. Not AI replacing humans — but humans becoming managers of AI teams.

SLIDE 19 · Summary — Key Takeaways

Let me bring everything together in six simple points.

- AI Agents are programs that can **think, plan, and act on their own** to complete goals.
- They use tools like web search, email, and code — just like we do, but automatically.
- They are already in products you use — Microsoft Office, customer service chatbots, and trading platforms.
- The benefits are huge: speed, scale, accuracy, 24/7 work, and cost savings.
- There are challenges — AI can make mistakes, and human oversight is still needed.
- The market is growing fast. **Now is the time to learn and get started.**

■ One action point to give the audience: 'This week, try ONE AI agent tool — ChatGPT, Claude, or Microsoft Copilot — for any task you do repeatedly. Just one. See what happens.'

SLIDE 20 · Thank You — Q&A;

■ All three speakers come to the front together for this final slide.

[Speaker 1]: 'We covered a lot of ground today. AI Agents are not just a future technology — they are here right now, and they are changing how work gets done.'

[Speaker 2]: 'From customer service to cybersecurity, from research to marketing — no industry is untouched. The examples we showed you are live, real, and growing.'

[Speaker 3 — you]: 'And the best part? You do not need to be a programmer or a tech expert to get started. The tools are simple. The learning resources are free. The only thing stopping you is starting.'

Thank you so much for your time. We are happy to answer any questions!

■ *If no one asks first, start with: 'We'll kick things off — what is one task in your daily work that you would most want to automate?'*
